REACH Substances

Electromagnetic Industries support the goals of REACH (Registration, Evaluation, and Authorization of Chemicals) which are consistent with our own commitment towards responsible use and handling of chemicals. The European Union passed new legislation that oversees the registration, evaluation, and authorization of particular chemicals within the European Union community. REACH requires that all existing and new substances be registered with the European Chemicals Agency (ECHA).

After review of the legislation and most notably the definition of an “article” as defined in EC Regulation 1907/2006, it is within the view of Electromagnetic Industries LLP that our Current Transformers and Voltage Transformers are considered “articles.” However, registration of an article is only required if it contains a named substance that “is intended to be released under normal or reasonably foreseeable conditions of use,” Electromagnetic Industries LLP’s analysis is that these products constitute non-registerable articles for their intended use.

Based on the information provided to us by the suppliers, none of the current Substances of Very High Concern (SVHC) are intentionally included in our Current Transformers and Voltage Transformers.

Electromagnetic Industries is working with its suppliers to ensure that they follow REACH requirements. As the REACH regulations continue to evolve, we will monitor the requirements and SVHC list, and take appropriate actions as required.

The most up to date information on current list of SVHCs under REACH is available on this website: <https://echa.europa.eu/candidate-list-table>
